

Claims

What is claimed is:

1. A method of determining  $ElogD_{oct}$  for chemical compounds which comprises:
  - a. Introducing said chemical compounds serialim to the column of  
5 reverse phase high performance liquid chromatographic system said column being an embedded amide functional group column; or a C-18 bonded column with low silanol activity; and
  - b. Eluting said compounds with a mobile phase containing MOPS buffer and a methanol/octanol mixture in which the proportions of said methanol/octanol mixture to said  
10 buffer are from 75 to 15% v/v; and with flow rates between 0.5 and 3 ml/min and
  - c. Measuring the retention time required to elute each sample from said column; and
  - d. Calculating  $ElogD_{oct}$  from the retention time of each sample using equation 1:  
 $logD_{oct} = 1.1267 (\pm 0.0233) \log k'_w + 0.2075 (\pm 0.0430)$  (Eq. 1).
- 15 2. The method of claim 1 wherein said compounds for which  $ElogD_{oct}$  is to be determined are divided into groups according to calculated lipophilicity based on chemical structure and;  $ElogD_{oct}$  is determined for all samples in a first group and; said column is equilibrated to the conditions for a second group.
3. The method of claim 1 wherein each of steps a) through d) is performed by  
20 robotic means under the control of a programmed computer.
4. The method of claim 1 wherein said column is an embedded amide functional group column.
5. The method of claim 1 wherein said column is a C-18 bonded column with low silanol activity.
- 25 6. The method of claim 1 wherein the buffer pH is between 4 and 8.
